

# APPLYING BAYESIAN STRUCTURAL INFERENCE TO PITCH SEQUENCES IN MUSIC

Anastasiya Salova

*Chorales* J. S. Bach

118. Kyrie! Gott Vater in Ewigkeit

Ky - ri - et Gott Va - ter in E - wig - keit! Gross ist  
Ky - ri - et  
Ky - ri - et Gott Va - ter in E - wig - keit!  
Ky - ri - et Gott Va - ter in E - wig - keit! Gross ist dein'

# WHY MUSIC USING BSI?

A lot of similarity to languages. Has analogues to letters (notes, duration), words (measures or sequences), sentences (phrases), suggesting similar techniques can be used. Good candidate to apply BSI techniques to (don't have to assume a finite order Markov).

Information measures in music can be useful. E.g. genres can be discriminated using entropy measures (e.g. *Music viewed by its Entropy content: A novel window for comparative analysis*, G. Febres, K. Jaffé). Information measures can be obtained from BSI.

Can produce music samples from inferred machines as a “side effect”. Another way to evaluate BSI performance.

# PROJECT GOALS

Apply Bayesian Structural Inference techniques to simplified music pieces. Using the posterior distribution, calculate various information quantities (excess entropy, crypticity, etc.)

Compare the information quantities for different composers and genres. Compare the entropy measures with those obtained using other methods.

See if one can find the correspondence between the inferred  $\epsilon$  –machine topologies and music theory rules. E.g., is there a state corresponding to cadential sequences?

# INPUT

Bach chorales available in music21 corpus.  
Can extend to other composers.

*Every Note*

*Chorales* J. S. Bach

118. Kyrie! Gott Vater in Ewigkeit

Example: bwv371

Parameters (can be obtained using music21 toolkit) for each piece:

- Voices (Soprano, Alto, etc.)
- Pitches
- Duration
- Rests
- Chords
- Key signatures
- etc.

# ISSUES WITH USING BSI

Assuming no prior knowledge about the structure of the machine, need to sample over all possible  $\epsilon$  –machines of a given range of sizes.

- Potentially large alphabet size (7+), which leads to large number of  $\epsilon$  –machines of a given size.

Dealing with that issue: get a sample of 1000-5000 randomly chosen  $\epsilon$  –machines, find the most probable among those.

- Relatively short sequences ( $\sim 100$ -200 symbols in my case)
- Several non-independent observables to chose from: pitch, duration, key, chord, etc.

Simple case: one part (Soprano), only considered pitch.

States	Machines
$n$	$F_{n,2}$
1	1
2	7
3	78
4	1,388
5	35,186

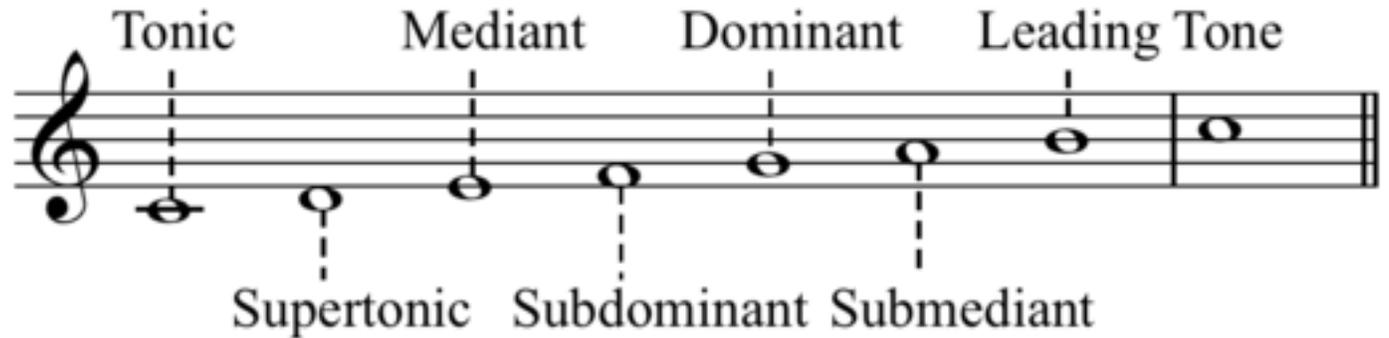

Number of  $\epsilon$  –machines for 2 symbol alphabets. From Crutchfield, Ellison, Mahoney, 2009

# USED DATA: EXAMPLE

bwv42.7

bwv42.7: soprano.  
Captures most of the  
melody

In scale degree representation: 7 symbols+1 for all the other pitches. Applicable to diatonic scale.

# FROM PITCHES TO SCALE DEGREES

## EXAMPLE: BWV190.7-INST

2 sharps, mode major: D major key signature, ['D', 'E', 'F#', 'D', 'A', 'B', 'C#']

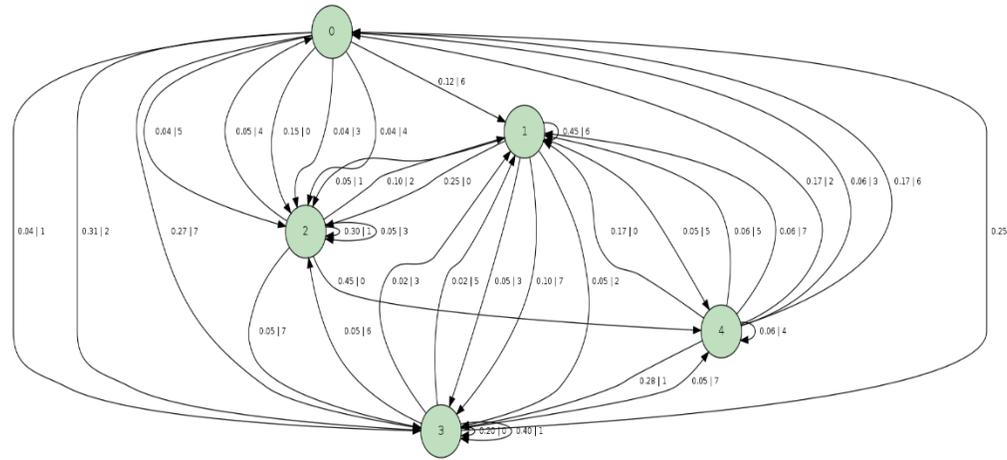

F#5 F#5 D5 E5 F#5 G5 E5 E5 E5 D5 D5 C#5 D5 E5 E5 E5 E5 F#5 D5 D5 D5 C#5  
D5 E5 E5 D5 F#5 F#5 D5 E5 F#5 G5 E5 E5 E5 D5 D5 C#5 D5 E5 E5 E5 E5 F#5 D5  
D5 D5 C#5 D5 E5 E5 D5 C#5 C#5 C#5 C#5 C#5 D5 D5 C#5 C#5 C#5 C#5 C#5  
D5 D5 F#5 F#5 D5 E5 F#5 G5 F#5 F#5 E5 F#5 D#5 D#5 E5 F#5 F#5 D5 E5 F#5  
G5 F#5 F#5 E5 F#5 D#5 D#5 E5 F#5 F#5 D5 E5 F#5 G5 E5 E5 E5 D5 D5 C#5

Scale degree representation (7 for notes not in key signature):

['2','2','0','1','2','7','1','1','1','0','0','6','0','1','1','1','1','2','0','0','0','6','0','1','1','0','2','2','0','  
1','2','7','1','1','1','0','0','6','0','1','1','1','1','2','0','0','0','6','0','1','1','0','6','6','6','6','6','0','  
0','6','6','6','6','6','0','0','2','2','0','1','2','7','2','2','1','2','7','7','1','2','2','0','1','2','7','2','2','  
1','2','7','7','1','2','2','0','1','2','7','1','1','1','0','0']

# EXAMPLE: BWV190-INST INFERRED MACHINES

Highest probability machine, out of a random sample of 1000 machines with 5 states

bwv190.7-inst

Random or inferred EM?

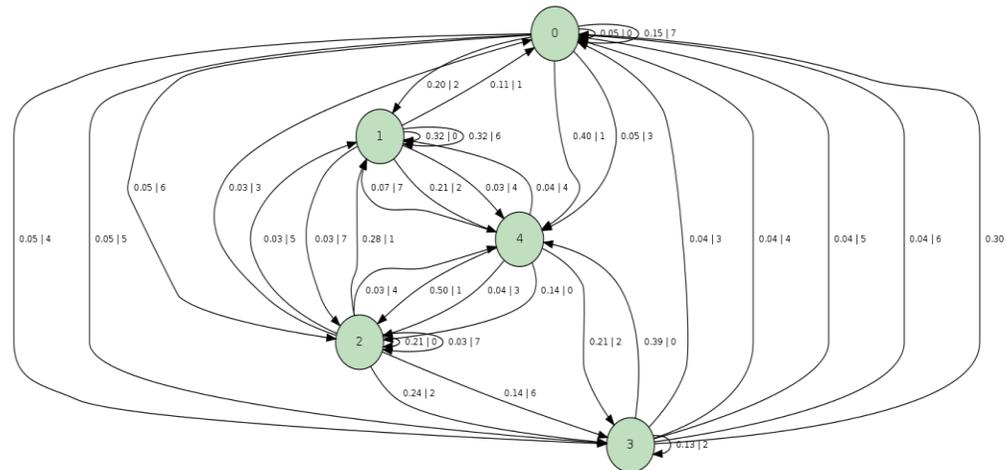

Random or inferred EM?

Random or inferred EM?

Highest probability machine, out of a random sample of 5000 machines with 5 states

# EXAMPLE: BWV190.7-INST INFERRED MACHINE SAMPLE SEQUENCES

bwv190.7-inst

Assuming the same rhythmic structure as the original piece: room for improvement. Can also add key progressions.

Random

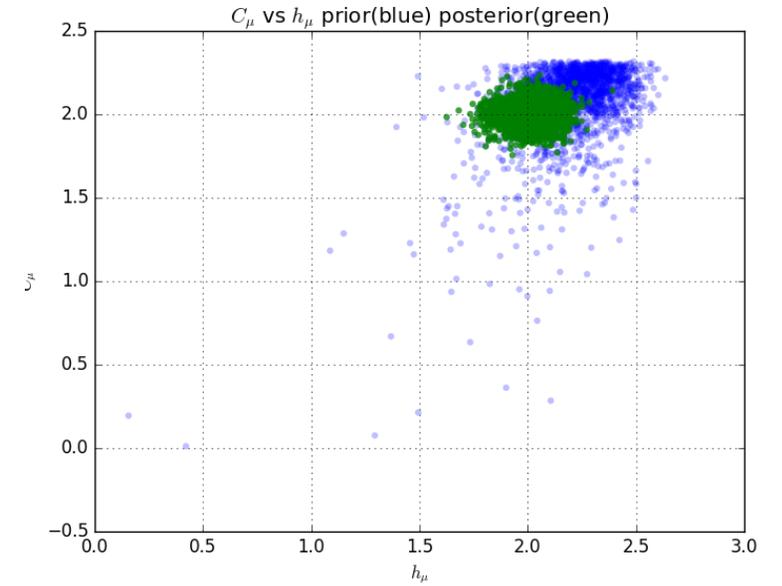

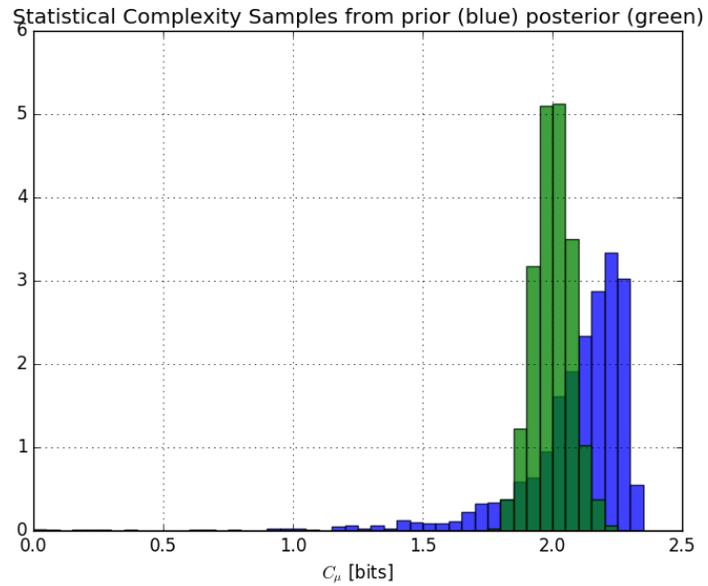

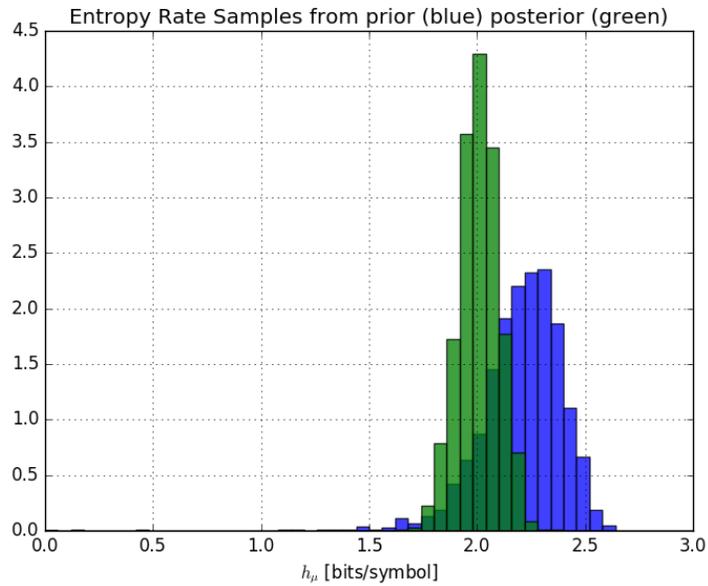

From inferred EM

From inferred EM

# ENTROPY RATE AND STATISTICAL COMPLEXITY ESTIMATES FOR BWV190.7-INST

# FUTURE WORK

Similarities in structure: could use BSI on several samples and infer the most probable model for all?

Exploring rhythmic entropy, chord progression entropy, etc.

Interpreting the obtained entropy measures, comparing them with those presented in literature.
